

FIT1008 – Intro to Computer Science

Tutorial 9

Semester 1, 2018

Objectives of this tutorial

- To understand recursion.
- To understand Quick sort and Merge sort.

Exercise 1

Consider a *Node* class which defines a node for a linked data structure, and which is defined as follows:

```
1 class Node:
2     def __init__(self, item = None, link = None):
3         self.item = item
4         self.next = link
```

Suppose you have a *List* class that implements a Linked List using the *Node* class above, and has the following method.

```
1 def mystery(self):
2     mystery_aux(self.head)
3
4 def mystery_aux(current):
5     if current == None:
6         return 0
7     else:
8         current.item += mystery_aux(current.next)
9         return current.item
```

- What does the method do? Explain in terms of its effect on the value of `a_list`, that consists of the following items in order 1,2,3,4,5.
- What is the best and worst complexity in Big O notation of our `mystery()` method in terms of the length of the list (N)?
- How would you define the method iteratively?

Exercise 2

- Write a recursive method for computing the sum of the digits of a number. For example, for number 979853562951413, the sum of its digits is

$9 + 7 + 9 + 8 + 5 + 3 + 5 + 6 + 2 + 9 + 5 + 1 + 4 + 1 + 3 = 77$. To do this you can use integer division by 10 ($//10$) which returns an integer with the same digits except the last one, and remainder by 10 ($\%10$), which returns the last digit.

- (b) Determine its complexity, in Big-O notation.

Definition: The *digital root* of a decimal integer is obtained by adding up its digits, and then doing the same to *that* number, and so on, until you get a single digit, which is the digital root of the number you started with.

For example, to find the digital root of 979853562951413, we calculate:
 sum of digits =
 $9 + 7 + 9 + 8 + 5 + 3 + 5 + 6 + 2 + 9 + 5 + 1 + 4 + 1 + 3 = 77$, then
 sum of digits = $7 + 7 = 14$, then sum of digits = $1 + 4 = 5$. Now we have just one digit, 5, so that's the digital root of the number we started with.

- (c) Write a recursive method to compute the digital root of a positive integer.
- (d) Determine its complexity, in Big-O notation.

Exercise 3

In the Quick sort algorithm, the choice of pivot is crucial. Discuss the reasons for this and give some examples of good/bad choices.

Exercise 4

Are Merge sort, or Quick sort stable?
